READER COMMENT SHEET

STARS II SRB (STARS B)

Issue _____. DATE ____/____/____

We welcome your evaluation of this bulletin. Your comments and suggestions help us to improve our publications.
Please use additional pages if necessary.

Is this bulletin technically accurate? Yes [] No [] (If no, explain under Comments, below.)

Are the concepts and wording easy to understand? Yes [] No [] (If no, explain under Comments, below.)

Is the format of this bulletin convenient in size, arrangement and readability? Yes [] No [] (If no, explain or suggest improvements under Comments, below.)

P R E F A C E

This Software Release Bulletin documents all fixes and enhancements that are incorporated in the new release identified on the cover page. The SRB is provided as a benefit of Hewlett-Packard's Account Management Support, Response Center Support, and Software Materials Subscription.

Of the five sections contained in the SRB (not including the PREFACE), only the last section which contains the detailed reports has page numbers. These are referenced by the product, report number and keyword indexes in order to direct the user to a particular area or to an individual detailed report. The five sections are described below.

SOFTWARE RELEASE CONTENTS

This section lists the product names, numbers and update/fix levels of all products contained in this release. Products that have changed, or are new are denoted with an asterisk preceding the product name.

PRODUCT INDEX

Each unique product name/number has an entry listing the page number where the detailed report for that product begins.

REPORT NUMBER INDEX

This index is a sequential list of the individual report numbers with the corresponding page number where the report can be found.

KEYWORD INDEX

This index is sorted by product name, keyword, product number (including the update/fix level) and by report number in that order. In addition to the sort items, each entry has a brief description (one line) and the page number where the detailed report can be found. Note that a given report can be listed more than once in this section if it has more than one keyword assigned to it.

DETAILED REPORTS

Each report contains all the available information relevant to the problem being corrected or the enhancement being implemented.

One-line description:

msinit (1) removes configured meas syst on discless clusters.

Problem:

The reconfig64 script (run by init64120 run by msinit) is used to create/remove context-dependent files (CDF) on discless clusters. If a discless node gets removed, this script is suppose to remove any configured measurement systems and corresponding executables associated with the node. However, this script treats discless nodes that are turned-off as if they were removed and subsequently removes any configured systems for those nodes. This script should not remove any files when a discless node is only powered-down.

One-line description:

pwd truncates the /net/system portion of the path when RFA'ed to system.

Problem:

When using the HP 64000-UX products and netumaming across the LAN to another system, such as a compile server, the HP-UX command "pwd" which is used by the HP64000-UX product to tell what the local directory is, truncates the "/net/system" part of the path.

This is a HP-UX operating system defect. It is not a defect in the HP 64000-UX application software. As soon as this defect is fixed in HP-UX, it will work correctly when using the HP 64000-UX applications.

Signed off 02/29/88 in release A01.20

Number: D200080929 Product: 68008 EMULATION 300 64244S004 01.00

One-line description:

Using Emulation across RFA can give incomplete symbol information

Problem:

Accessing symbol data in a remote file across RFA may result in incomplete symbol information being available. This problem is a result of read() calls being interrupted during file access over RFA.

This problem can also affect reading absolute data into memory as well.

Temporary solution:

If this problem occurs while loading absolute data, attempting to reload the file again may work.

There are two possible answers to this problem. The first is to move the .Y file to the machine running the emulator.

The second solution is to move the program object to the machine which is running the emulator. This can be done using the get64 program. When you load the emulator, a new .Y file will be created.

One-line description:

Relative path names (e.g. ./cmd) should not search PATH

Problem:

A new feature was added to the core feature set to search for command files using the users PATH variable for a search path. A defect has been introduced such that specifying a relative path with a command file still has the command file looked for in the search path.

Relative path names should override the PATH variable like they do in a standard shell. Only names not containing any '/' should be searched for using PATH. All others (especially ./name) should be used relative to the current directory.

Temporary solution:

Specify command files with full path names if the application is unable to find your command file.

One-line description:
Display local symbols erroneously requires a ".s" suffix.

Problem:
Emulation commands requiring file names for local symbols erroneously require a ".s" suffix, regardless of the actual file extension. Example:

A local file mon_68020.S is part of the absolute file.
After loading the absolute file, the command "display local_symbols_in mon_68020.S:" is issued. In response, the message "symbol not found" is displayed. If you replace mon_68020.S with mon_68020.s, the symbols are shown. Similarly, filenames without extensions require that a ".s" be appended for proper operation.

One-line description:
Relocatables cause problems with new ld68k

Problem:
Symptoms: When linking, undefined symbol errors occur which did not occur with version 1.00 tools. For example,

< ld68k >
ERROR: (320) UNRESOLVED EXTERNALS:

SYMBOL	MODULE
dat.1	via

Also, when using HP 64000-UX Emulators and Analysis Tools, local symbols in files assembled with Version 1.00 of the assembler are inaccessible. For example,

- -8

SRB detail reports as of 04/29/88

Page: 16

ERROR: symbol not found _____

when doing a command like the following.

display local_symbols_in vib.s:

Description: The version 1.00 tools have two features which are incompatible with newer versions of the product.

First, in version 1.00, the -h option, in both as68k and ld68k, has a side effect on symbols. The -h option causes symbols to be transformed in the following way. Periods (.), dollar signs (\$), and question marks (?) are changed to underbar (_). Symbols are truncated to 15 characters maximum. These transformations allowed external references to match definitions even when the symbols were not spelled identically.

Version 1.10 tools no longer have this side effect. Undefined symbols sometimes occur because of this behavior change.

Second, the format of the IEEE relocatable changed between version 1.00 and version 1.10. Consequently, the link_sym file, produced by ld68k, contains an incorrect filename symbol. The HP 64000 tools are unable to access local symbols as a result.

The code from version 1.00 relocatables is still correct and usable when linked with the version 1.10 tools.

This defect will not be corrected in future versions.

Temporary solution:

Reassemble all your modules with the new version 1.10 assembler before linking. If, for some reason, you cannot do this, you may still link the old relocatables using the new ld68k. Correct undefined symbol errors by defining new symbols as necessary. Local symbols from the version 1.00 modules will be inaccessible.

One-line description:
C Symbols longer than 31 characters cause ld68k core dump

Problem:
Symptoms: When linking modules produced by either cc68020 (64903S - Advanced C Cross Compiler for Motorola 68020) or the recommended Microtec compiler mcc68k, ld68k terminates with the following message.

Memory Fault - Core Dumped

- -8

SRB detail reports as of 04/29/88

Page: 17

Description: If, in C, one writes an identifier longer than 31 characters, the debug information written by the compiler eventually causes ld68k to abort. For example,

```
void a_very_very_long_c_function_name()
{
    return;
}
```

Temporary solution:

Shorten the identifiers in your C program. Alternatively, you may suppress the generation of compiler debug information by specifying the -s option with cc68020 or by omitting the -d option with mcc68k.

One-line description:

Public Symbols causing Section Mismatch have wrong value

Problem:

Symptoms: Unpredictable behavior when executing your program accompanied by the following warning message when the program was linked.

```
< ld68k >
WARNING: (324) Section Mismatch Between Symbol Def and Ref x1
```

In addition, for the problem to occur, the symbol x1 must be defined using the PUBLIC command in the loader command file.

Description: The XREF directive allows you to specify the section in which you expect an external symbol to be defined. For example,

```
XREF Sect1:x1 ; x1 will be defined in section Sect1
```

The "Section Mismatch" warning occurs when x1 is actually defined in some other section.

If, in addition, the symbol x1 is defined by a PUBLIC command, the value of symbol x1 is unpredictable. References to x1 access unpredictable locations and program behavior is unpredictable.

Temporary solution:

Eliminate the section name from the XREF directive. This will cause the linker warning to disappear. Alternatively, you can define the symbol in an assembly module rather than a PUBLIC command. This also eliminates the problem.

One-line description:

Unpredictable behavior when executing your program.

Problem:

Symptoms: Unpredictable behavior when executing your program.

Also, when using HP 64000 emulators and analysis tool, certain global and local symbols are inaccessible. For example,

ERROR: symbol not found _____

display local_symbols_in mod1.s:

The IEEE absolute, HP absolute, HP link_sym, and/or Motorola S-Record files produced by ld68k are sometimes incomplete. Code from certain modules is omitted from the absolute files. Symbols from the same modules are also omitted from the symbolic parts of the files.

The loader listing gives no indication of any problem.

Description: This problem occurs when all three of the following conditions occur.

1. There is a LOAD command for a library file and the library file resolves no external references.
2. There are additional LOAD commands which load non-library modules following the LOAD command described in number 1.
3. There are no external references to the non-library modules described in number two. In this case, these non-library modules are omitted from the absolute and symbolic output files. The load map erroneously indicates that they are loaded.

For example,

LOAD lib1.a * Unnecessary LOAD which resolves no references

- -8

SRB detail reports as of 04/29/88

Page: 20

LOAD mod1.o * Code/symbols from mod1 are omitted from output

Also, when using the AxLS compiler with the -l (specify library) and -k (specify linker command file) options.

cc68020 file.c -k cmd -l x

When cc68020 invokes ld68k, the LOAD command for library libx.a will precede any LOAD commands in file cmd. Thus, if libx.a resolves no references, it is possible that some ordinary files LOADED in cmd might be omitted.

Temporary solution:

There are two ways to avoid the problem.

1. Remove the unnecessary library LOAD command. Since the library resolves no references, it need not be loaded.
2. Arrange the LOAD commands so that all libraries are loaded after all non-library modules.

One-line description:

Sometimes C functions are not recognized as functions.

Problem:

Symptoms: This problem occurs with modules produced by the AxLS C compilers (cc68020 and cc68000). When using HP 64000

- -8

SRB detail reports as of 04/29/88

Page: 21

emulators and analysis tools to debug C programs, sometimes the instrument fails to recognize a function. For example,

```
int func1()
{
    return 1;
}
int func2()
{
    return 2;
}
#pragma SECTION prog=0x1000
int func3()
{
    return 3;
}
```

The command "display global_symbols" produces the following.

Global symbols in er

Procedure symbols

Procedure name	Address range	Return	Segment	Offset
_func2	000008-	00000F	PROG	000008

Static symbols

Symbol name	Address range	Contents	Segment	Offset
_func1	000000	7001	PROG	000000
_func3	001000	7003		

Notice that _func1 and _func3 are not listed under the procedure heading although they are listed under the static heading as ordinary symbols.

Description: Sometimes as68k fails to write an "E-label" to the asmb_sym file. The E-label is used by the emulators to recognize the end of a C function. As68k fails to write the E-label in two situations.

1. Sometimes the first function in a module fails to get an E-label.
2. Functions that are ORGED at an absolute address always fail to get an E-label.

Temporary solution:

The first situation can be avoided by inserting a dummy function at the beginning of a module.

For the second situation, one must use the "#pragma SECTION" to make the function relocatable. One may then locate the function using the loader.

One-line description:

include files with executable code causes problems debugging.

Problem:

Symptoms: This problem occurs when debugging modules produced by the AxLS C compilers (cc68020 or cc68000) or the recommended Microtec C compiler (mcc68k).

When using HP 64000-UX emulators and analysis tools, when loading a program, one sees the following warning.

Warning: duplicate symbol "# 3" in file "/users/me/myfile.c"

Also, an HP 64000-UX emulation session may simply terminate when doing a command like the following.

display trace symbols on

Description: A problem occurs when one uses the preprocessor #include directive to add executable statements to your C program. For example,

```
file.c           inc.h
-----
int i;           i += 2;
int f()          printf("%d",i);
{
#include "inc.h"
    return i;
}
```

When assembling the code produced by these files, as68k, when writing the asmb_sym file, erroneously writes line number symbols for lines in the include file. These line number symbols may duplicate line number symbols in the parent file. They also confuse the HP 64000 instruments when they try to do source line referencing.

Temporary solution:

The problem may be avoided in two ways.

Suppress the production of line number symbols. With cc68020, use the strip (-s) option. With mcc68k, omit the debug (-d) option.

Do not use include files which contain executable statements in your C programs.

One-line description:
as68k and ld68k core dump when out of virtual memory.

Problem:

Symptoms: When using as68k to assemble a huge source file, one may see the message,

Memory Fault - Core Dumped

When using ld68k to link together a huge amount of object code, one may see the message,

Memory Fault - Core Dumped

Description: On an HP-UX system, several things limit the maximum amount of virtual memory available to a process. These include the amount of swap space allocated on the disc and several system parameters. For more information, see config(1M) and the HP-UX System Administrator Manual.

As68k uses virtual memory approximately in proportion to the size of the input source file. When assembling huge source files, it may exceed virtual memory limits and core dump.

Ld68k uses virtual memory approximately in proportion to the size of the input relocatable files. When linking huge amounts of code, it may exceed virtual memory limits and core dump.

Temporary solution:

One may increase virtual memory limits on the HP-UX system. For the loader case, this is the only workaround. See the HP-UX System Administrator Manual.

For the assembler case, one may divide the input source file into two or more pieces.

One-line description:

Breakpoints not always recognized when breaking to monitor repetitively.

Problem:

68HC11 emulator may not recognize breakpoints that occur when internal memory is being displayed repetitively. The emulator appears to break into background when the breakpoint address is hit, but returns to the foreground, without any indication a breakpoint was reached. The status of the breakpoint remains pending, and subsequent occurrences of the breakpoint address may or may not cause a valid break.

Temporary solution:

Displaying the internal processor RAM will cause a break into the monitor. If you wish to display this memory repetitively, you will cause continuous breaks into the monitor.

One workaround that will eliminate any breaks into the monitor (and will hopefully make breakpoints work correctly) is to relocate the internal RAM to some other 4 KByte boundary (see the manual) and to remap the original location of the internal RAM to "emulation RAM". Reading emulation RAM does not require a break into the background monitor.

Signed off 02/29/88 in release A01.01

One-line description:

Registers corrupted when you continue emulation while uP in background

Problem:

68HC11 emulator may not retain correct register values if emulation session is left in background mode, and then continued. The customer leaves the emulator in background, does an end, and may or may not enter a different measurement system. When returning to the emulation session in a continuing mode, in which the emulator is NOT reconfigured, a display of registers may display different values than those when the emulator was left in background.

Temporary solution:

Link the following code with your user code.

```
GLOBAL EM_LOOP
```

```
EM_LOOP BRA $
```

Before ending out of the emulation session from a "break in background" state, note the current value of the PC and then execute a "run from EM_LOOP" command. This will leave the emulator in a "Running" state from which a safe end into meas_sys, some other emulator, or the 64000 monitor will be possible.

When reentering the emulator, execute the following.

Unable to use software breakpoints in user memory

Problem:

The software breakpoint problem has been verified while running out of target memory. A fix has been implemented, and is currently going through regression tests. The next F9450 emulation software release will incorporate this fix.

Temporary solution:

There are two temporary solutions available - (1) restrict software breakpoint usage to emulation memory only, (2) modify emulation monitor program and utilizes the hardware break routine in place of the software breakpoints. The second solution will provide an entry into the emulation monitor program. The user must display the PC register to find out which software breakpoint is been detected and appropriately inactivate it and continue to execute out of user program. The exact modifications to the F9450 emulation monitor can be obtained through your local SE.

One-line description:
Measurement System end_released when terminal cannot be initialized

Problem:

A measurement system will be end_released, resulting in loss of data, when a non-supported terminal is used to enter a currently locked measurement system. This problem will arise if the TERM environment variable is not set to a value that is supported by 64000-UX. This may happen when logging in to a system over a port that is not hard-wired (modem, LAN vt, etc.) where the system prompts you for the Terminal type, which sets the TERM variable.

SRB detail reports as of 04/29/88

Page: 34

Temporary solution:

Make sure that the TERM variable is set to a type of terminal that is supported with 64000-UX. This can be verified by typing "echo \$TERM".

Using Emulation across RFA can give incomplete symbol information

Problem:

Accessing symbol data in a remote file across RFA may result in incomplete symbol information being available. This problem is a result of read() calls being interrupted during file access over RFA.

SRB detail reports as of 04/29/88

Page: 35

This problem can also affect reading absolute data into memory as well.

Temporary solution:
If this problem occurs while loading absolute data, attempting to reload the file again may work.

There are two possible answers to this problem. The first is to move the .Y file to the machine running the emulator.

The second solution is to move the program object to the machine which is running the emulator. This can be done using the get64 program. When you load the emulator, a new .Y file will be created.
